# Security Challenges for Underwater Acoustic Sensor Networks

Dmytro Ochkas, PhD Student

Directrice: Hélène LE BOUDER  
Encadrant: Alexander PELOV

# Content

## 1. UASN - Underwater Acoustic Sensor Networks

- 1.1. UASN Structure and Topologies
- 1.2. UASN vs LPWAN

## 2. Security Challenges in UASN

- 2.1. Security Properties
- 2.2. Security Challenges

## 3. Attacks on UASN and Mitigation

- 3.1. Jamming
- 3.2. Eavesdropping
- 3.3. Message Tampering
- 3.4. Spoofing
- 3.5. Replay
- 3.6. Routing

## 4. Conclusion

# CHAPTER 1

## Underwater Acoustic Sensor Networks

## CHAPTER 1

# Underwater Acoustic Sensor Networks

### UASN - Underwater Acoustic Sensor Networks

- Acoustic wave communication
- Sensor nodes, sink nodes, and terrestrial gateways
- Collecting data and transmitting it to the application server

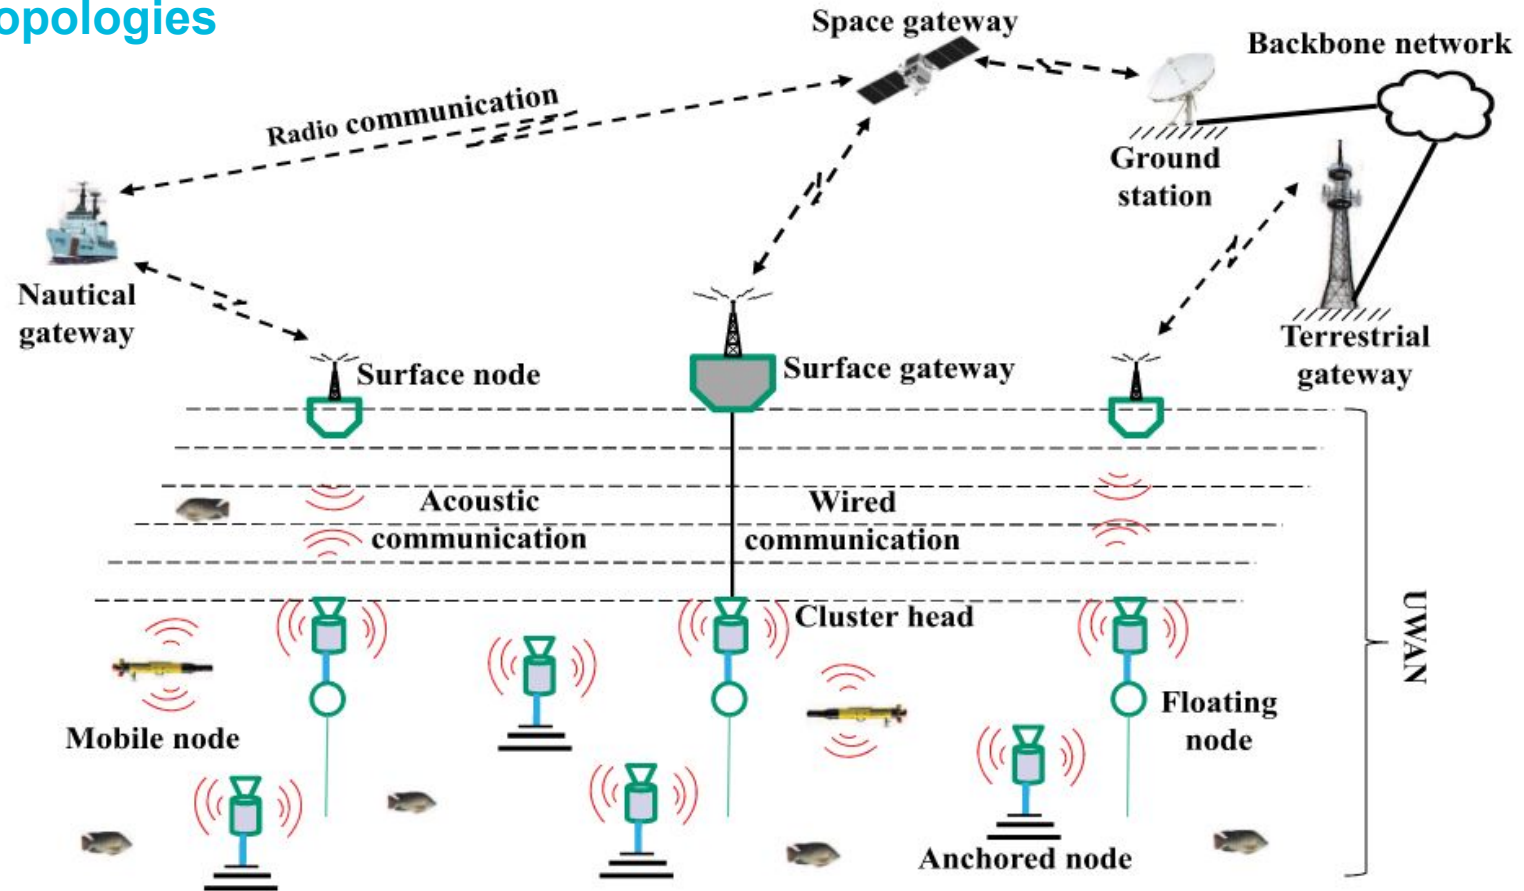

*UASN wind farm cable monitoring [1]*

## CHAPTER 1

# Underwater Acoustic Sensor Networks

## UASN Structure and Topologies

## CHAPTER 1

# Underwater Acoustic Sensor Networks

## UASN Structure and Topologies

### UASN [1]

### LPWAN [2]

## CHAPTER 1

# Underwater Acoustic Sensor Networks

## UASN Structure and Topologies

### Multi-hop UASN [1]

**FLG** - AUV of Folaga type

**FN** - Fixed Node

**C3** - Command and Control Center

## CHAPTER 1

# Underwater Acoustic Sensor Networks

## Comparing UASN and LPWAN

Criteria	UASN	LPWAN
Communication Type	Acoustic Wave	Electromagnetic Wave
Propagation Speed	~1500 m/s	~300,000,000 m/s
Bandwidth	few kHz	tens to hundreds of kHz
Range	Up to 30 km	Up to 15 km
Autonomy	1-6 months	1-10 years
Reliability	Highly unreliable (multipath, absorption, Doppler effect, scattering, noises)*	Moderate (multipath, scattering)
Bit Rate	~1 kbits/s	0.1 - ~100 kbits/s

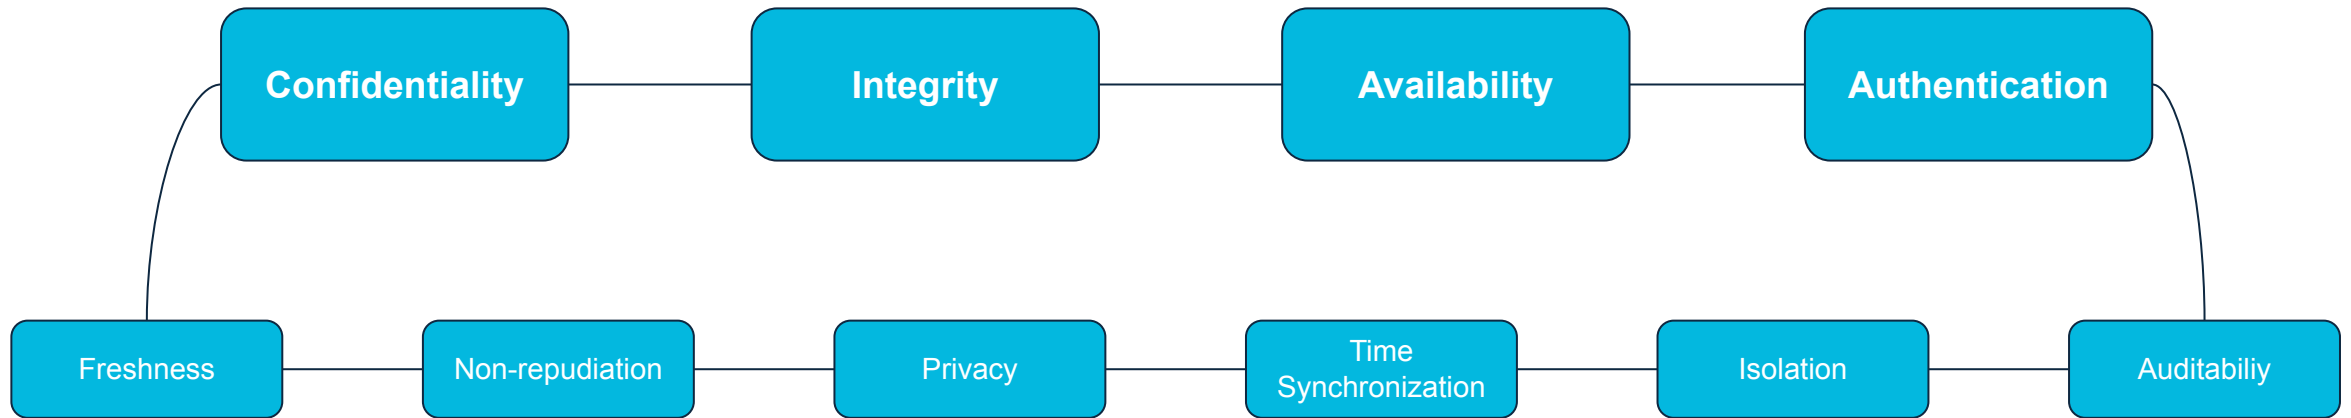

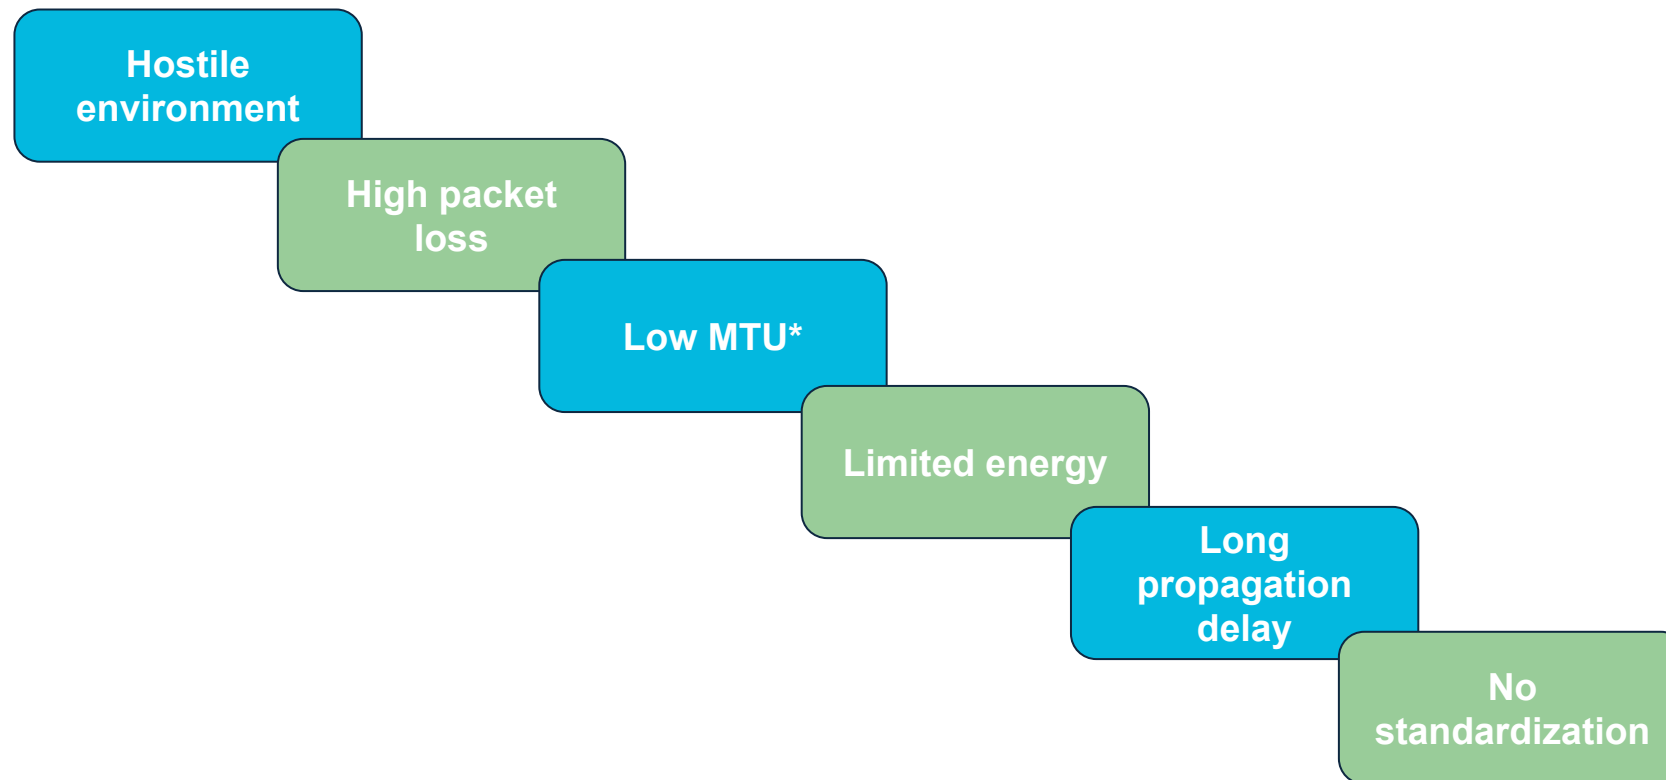

# **CHAPTER 2**

## Security Challenges in UASN

### Security Properties

### Security Challenges

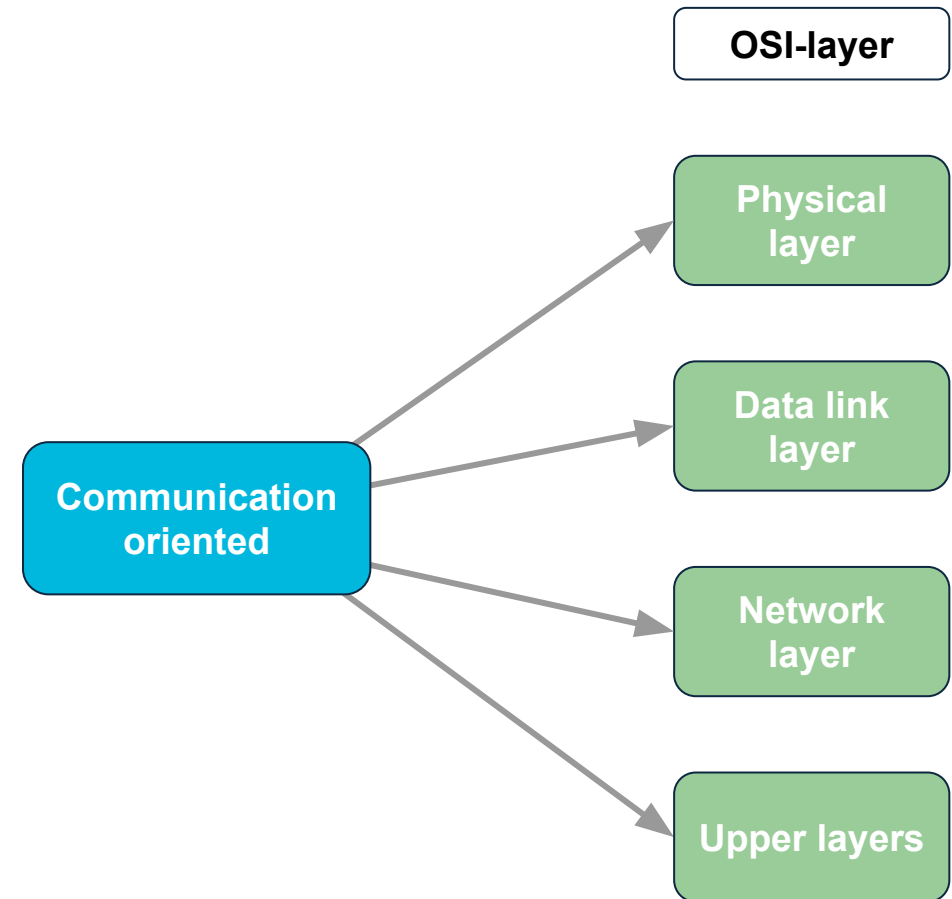

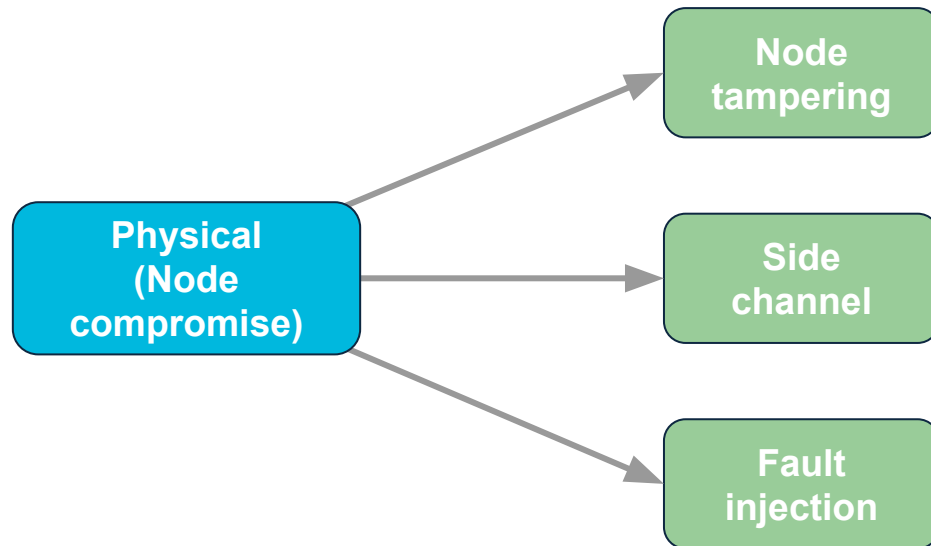

# CHAPTER 3

## Attacks on UASN and Mitigation

## CHAPTER 3

### Attacks on UASN

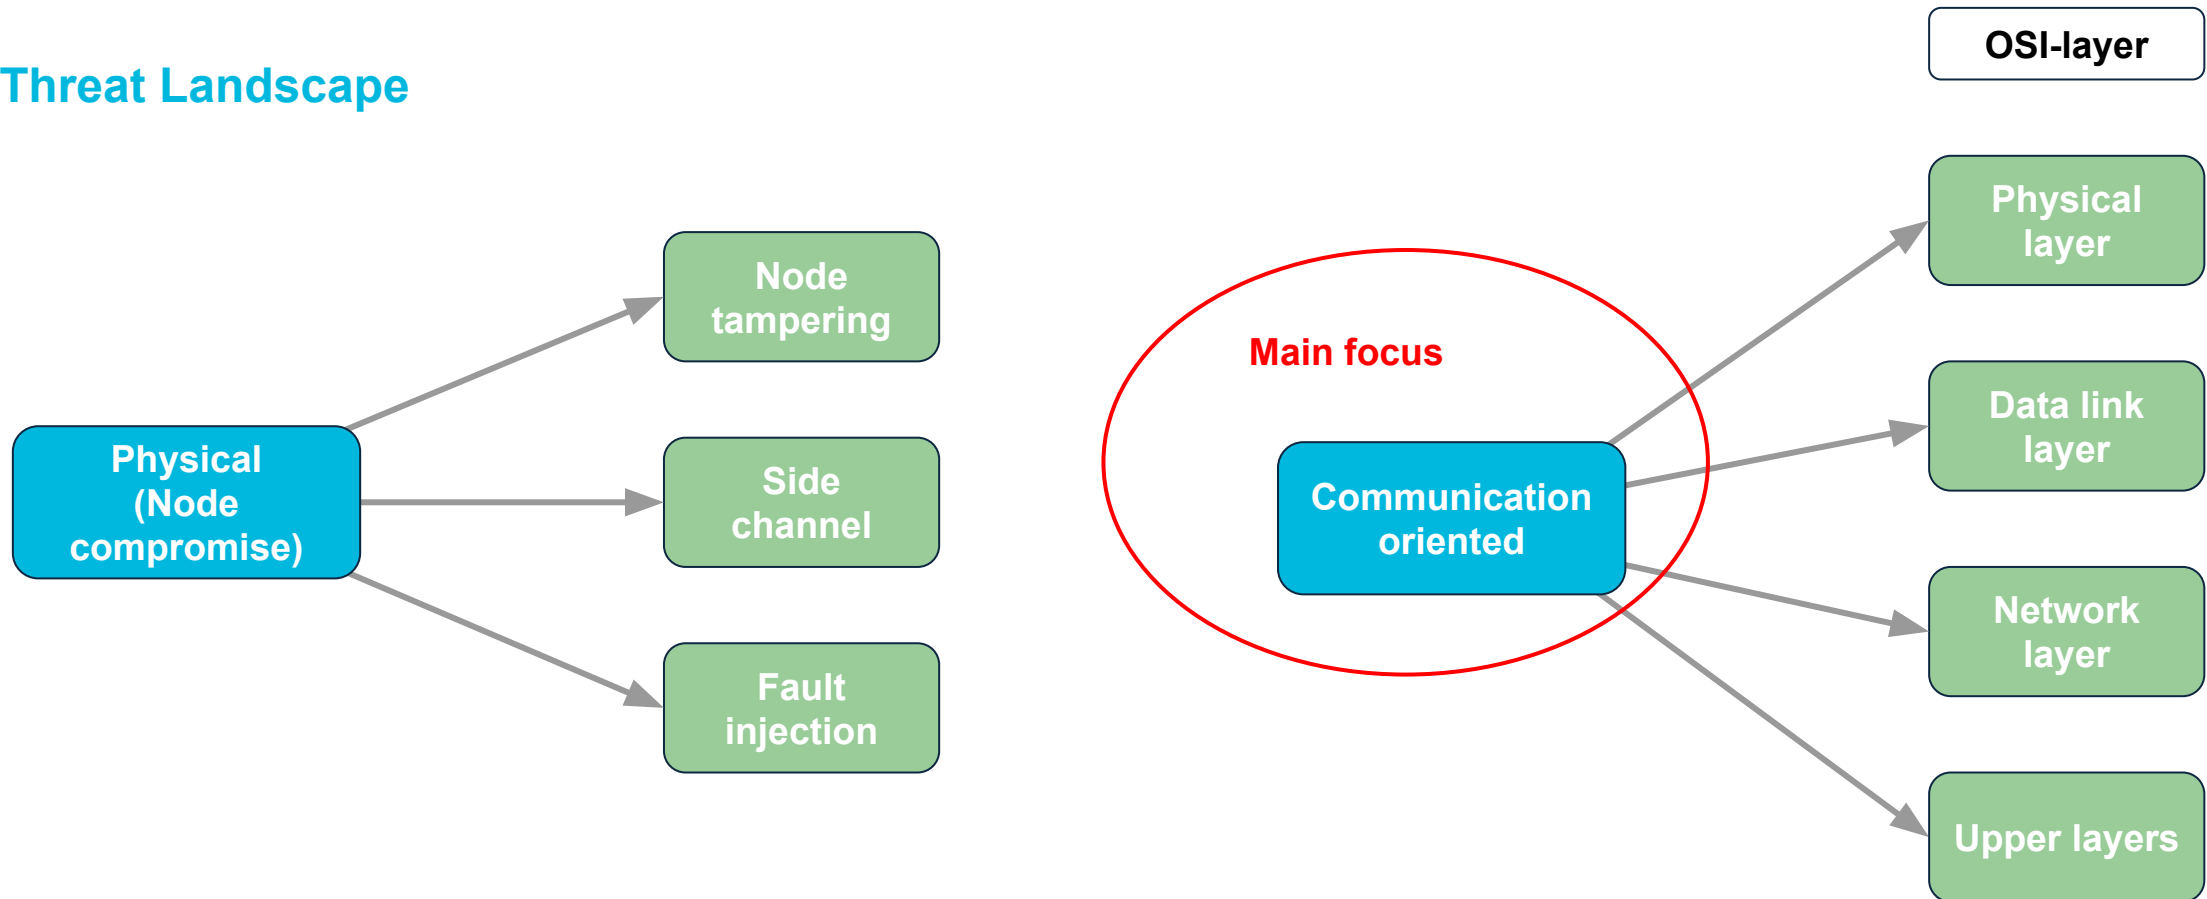

#### Threat Landscape

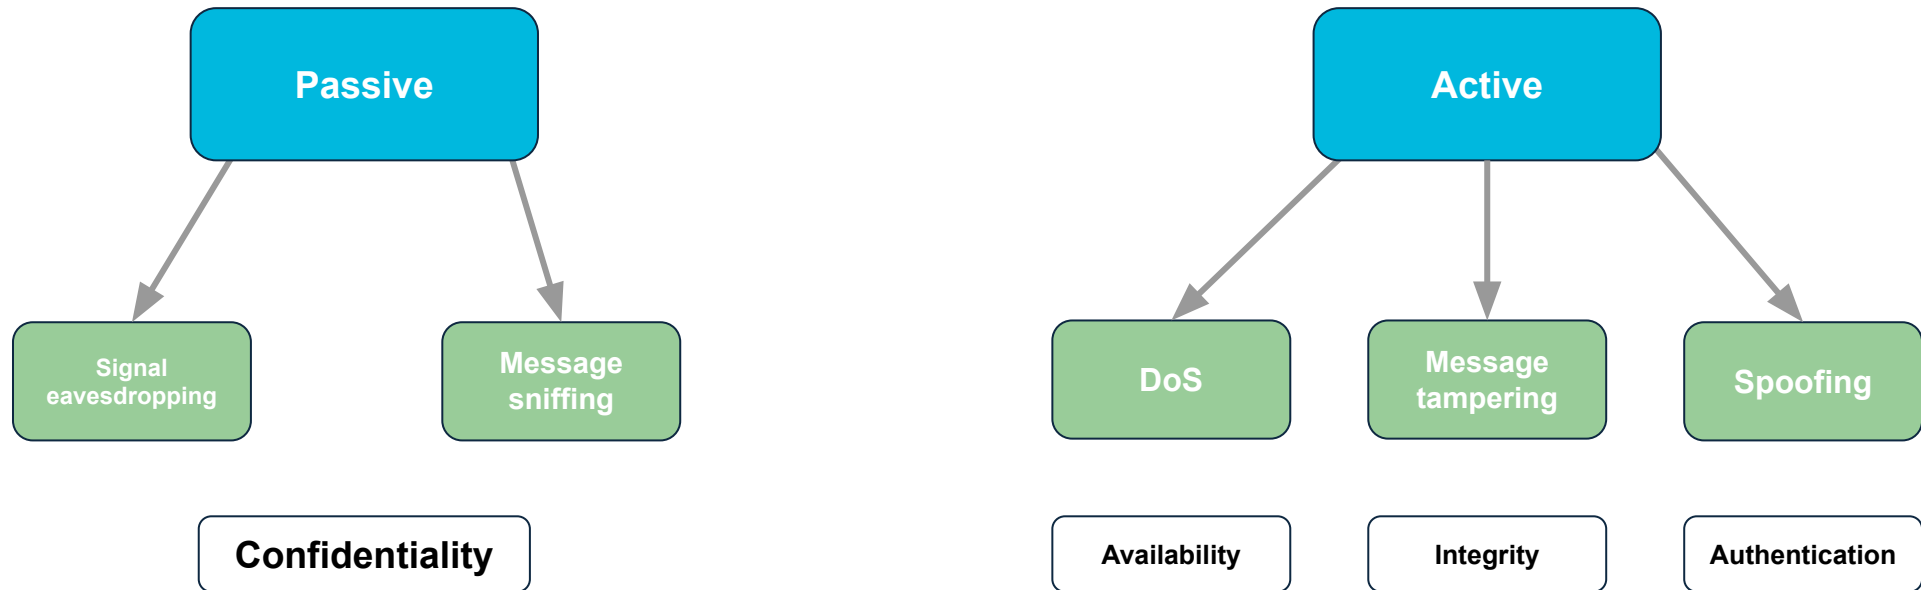

## CHAPTER 3

### Attacks on UASN

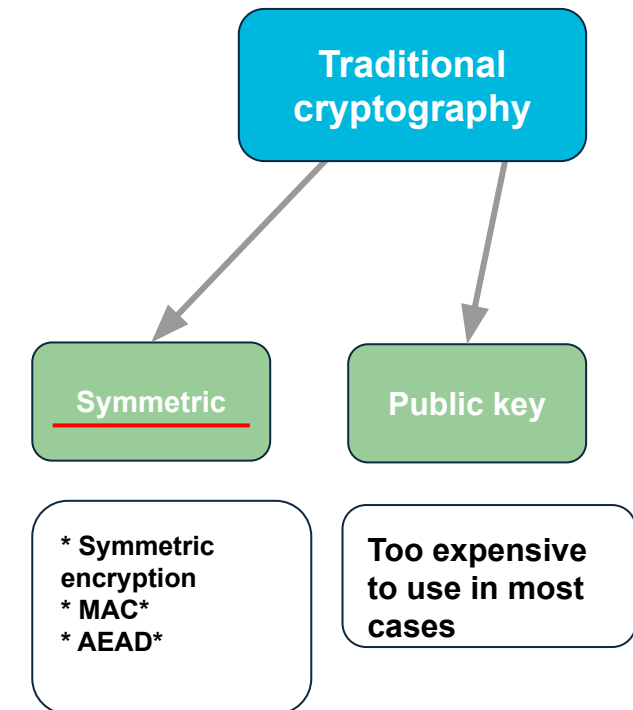

#### Threat Landscape

### Threat Landscape

## UASN Security Strategies

### Jamming

Put source

### Mitigation

- Obscuring the communication
- Constant network monitoring for anomalies:
  - high packet loss
  - high signal strength with low throughput
  - frequent retransmissions
- Switching to another frequency
- Shutdown for a certain period

### Eavesdropping

### Types

- Signal eavesdropping
- Message sniffing
- Traffic analysis

### Mitigation

- Physical layer confidentiality
- Lightweight encryption

#### Message Tampering

#### Mitigation

- Integrity
- Authentication tag, usually truncated to 2, 4, 8 bytes

### Spoofing

### Mitigation

- Reliable authentication mechanism
- Initial handshake (too expensive)
- Node identification mechanism
- Authentication tag

### Replay

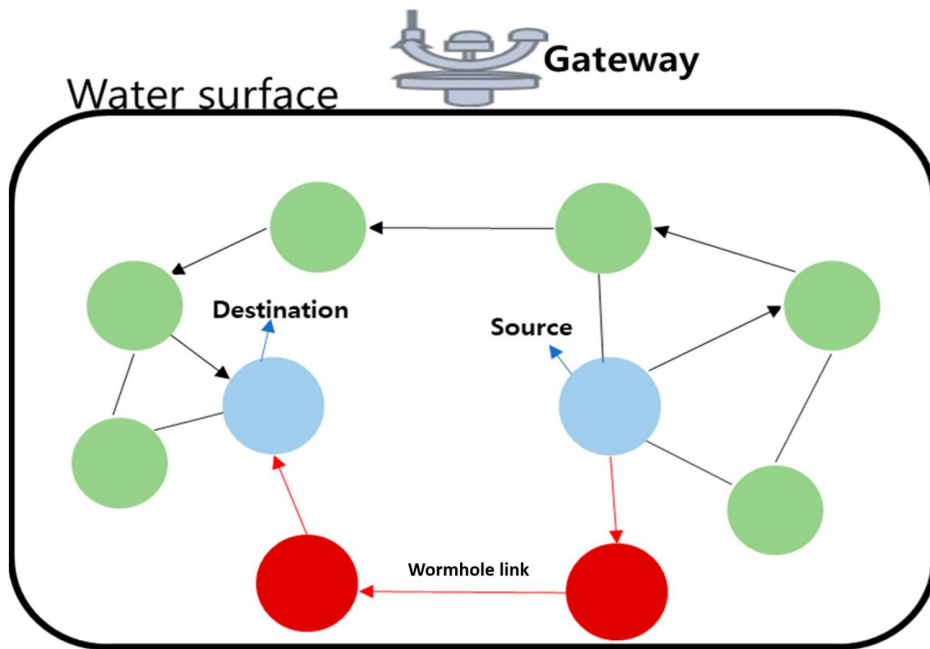

### Mitigation

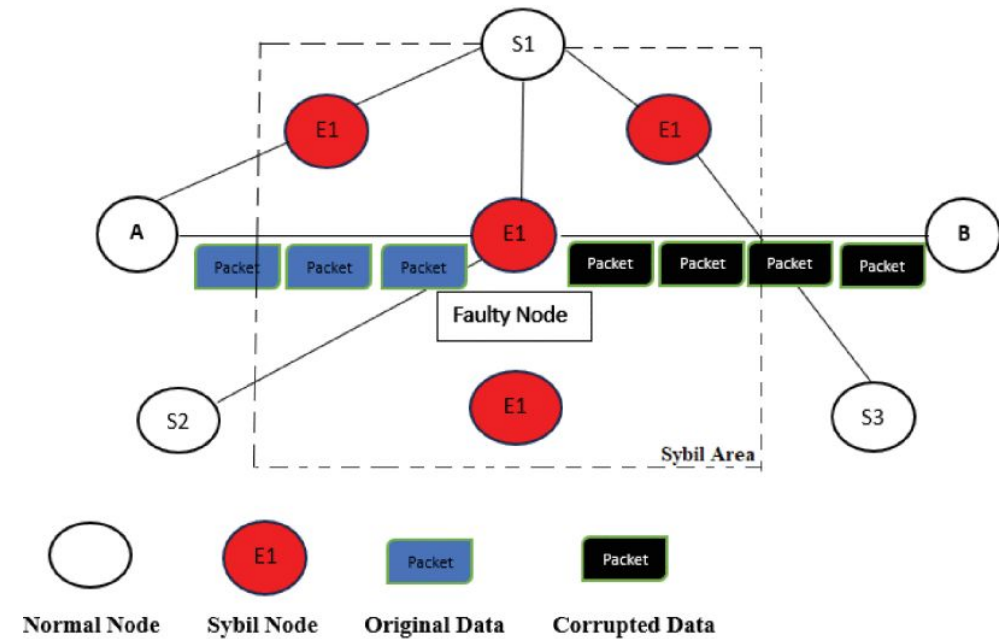

- Message ID
- Effective nonce usage, e.g., with timestamp

### Routing

#### Wormhole [1]

#### Sybil [2]

### Routing

### Mitigation

- Spoofing protection
- Secure localization
- Node isolation

### As for upper layer attacks...

- Lack of standardization
- As of today, poorly investigated

# Conclusion

- Acoustic networks remain the main way of underwater communication despite the hostile environment.
- UASN have a lot of similarities with LPWAN but the conditions are even more restrictive and multi-hop communication is widely adopted.
- Threat landscape is large and the new attacks keep occurring even today.
- Research effort should continue to create an efficient lightweight security model for UASN.
